

Myung Guk Lee

Dear Hiring Manager,

I am writing to express my strong interest in the Senior Embedded Systems Engineer position at SeeScan. With over 15 years of hands-on experience in embedded firmware development — from bare-metal device drivers to RTOS-based systems — I am confident I can make meaningful contributions to your team.

Why I'm a strong fit:

Throughout my career, I have worked exactly where software meets hardware. At GreenWave Radios, I develop multi-core SoC firmware on ThreadX RTOS, writing device drivers for SPI, UART, and PCIe interfaces. I designed a UART daisy chain communication architecture with SLIP framing for multi-node 5G systems, and implemented a CAST SPI-to-AHB bridge driver for FPGA register access — work that demanded hands-on hardware debugging and close collaboration with hardware engineers during board bring-up.

At Western Digital, over nearly a decade, I developed storage firmware in C for HDD and SSD platforms. I architected a unified security API adopted across 5+ product lines, shipped TCG-compliant firmware securing millions of enterprise drives, and implemented a PCIe AHCI device driver for hybrid HDD systems. This work honed my skills in bare-metal programming, secure boot implementation, and deep understanding of compilers, linkers, and memory-mapped I/O.

Earlier in my career at Dasan Networks and AnyData, I built embedded software for network switches and designed an OTA firmware update system that reduced field deployment time by 80%. These roles gave me a strong foundation in communication protocols, system reliability, and efficient resource management on constrained platforms.

Why SeeScan:

What draws me to SeeScan is your mission — building products that help people see what's otherwise hidden. I find it compelling that you manufacture your equipment from the ground up, which means the embedded work is central to the product, not an afterthought. Having spent my career bridging hardware and software, I thrive in environments where I can see the direct impact of my firmware on a physical system. Your emphasis on long-term team membership and continuous learning aligns with how I approach my career: I invest deeply in the products and teams I work with.

I am currently based in Orange County, CA and am willing to relocate to work onsite at your Kearny Mesa location. I would welcome the opportunity to discuss how my experience in embedded C/C++ development, RTOS programming, communication protocols, and hardware-software integration can contribute to SeeScan's continued innovation.

Thank you for your consideration.

Sincerely,

Myung Guk Lee
